

PLÜMAT

HIGH QUALITY MACHINERY IN RESPECT OF BAG MAKING; FILLING AND SEALING OF PHARMACEUTICAL FLUIDS, FORM FILL SEAL LINES; OVERPOUCHING SYSTEMS;

News: Aseptic Filling and Sealing machines for pre-sterilized bags

As family owned company with production location in Germany, PLÜMAT is technology leader for the processing of pharmaceutical solutions in flexible plastic packages made of polyolefins, as well as for special and customized machines particularly under aseptic production conditions. Wherever pharmaceutical products are filled under stringent hygiene conditions, customers trust PLÜMAT as a reliable partner offering Bag Makers, Filling Lines, Form-Fill-Seal Lines, Stretch Blow Fill Seal Lines for plastic bottles and Concept Solutions. It is PLÜMAT standard to produce all machines in accordance with cGMP guidelines and FDA requirements. PLÜMAT is also well known for the development of complete machine concepts, as the integration of the PLÜMAT Form Fill Seal Line with a recently developed PLÜMAT Overwrapping System proves. In the past a second, autarkic working overwrapping system was necessary, whenever filled bags left the PLÜMAT line and had to be packed into a secondary pack before sterilization to protect the primary pack against external contamination. By integration of the new PLÜMAT Overwrapper, no intermediate handling is necessary and material as well as operator costs are reduced tremendously. As newsworthy innovation, PLÜMAT will introduce on Pharmintech 2010 aseptic machine concepts for products, which cannot be post-sterilized as e.g. blood plasma, certain antibiotics, some types of enteral nutrition etc. Though brand new, several references can already be mentioned! A further novelty is the development and production of customized plastic parts like connectors, ports or closing systems which bear specific handling and selling advantages as well as production safety and will be offered exclusively to PLÜMAT machinery customers. PLÜMAT plastic components are produced under clean-room conditions that correspond to class C and D of the GMP classification.
