

SACMA SPA

SINCE 1952, SPECIALIST IN THE LOGISTIC FIELD OF PHARMACEUTICAL DISTRIBUTION

Since 1952 SACMA has been operating in the field of storage systems, with a particular regard to the industrial sector of pharmaceutical logistics. Given its acknowledged expertise, SACMA can count over a hundred installations made in the pharmaceutical distribution field, focusing on the picking areas and using both static and dynamic structures (live storage) which are deeply interlocked to the sorting and distributing lines. SACMA Engineering Dept. carefully designs the picking display, in order to best fit the different ergonomic needs and make the picking operations easier, leading to an improvement of the final job quality and of the operator's productivity. In the case of live storage, SACMA corporate quality policies require validating the original project through a campaign of tests conducted on a real-size prototype of the structure, which is specifically built for the Customer in SACMA productive plant in Sandigliano (BI). The Customer himself is finally asked to verify the quality of the design through a picking simulation with his own unit loads. In the case where storage areas are cramped or anyway impossible to expand, SACMA can build multiple-level free standing mezzanine floors or over rack mezzanine floors, allowing to recover difficult to use areas and increasing the available space without any structural modification on the building. In the field of pharmaceutical distribution, SACMA has built large rack-clad storage systems, which are actual buildings where the racking supports the roof and the walls. This kind of structure has very low costs and high speed of construction; besides this, the occupied areas are relatively small while the index of volumetric saturation is very high. Usually, rack-clad storage systems are served by automatic S/R machines, but SACMA has also realized mixed solutions, where manual picking can be performed via over-rack mezzanine floors.
